

Attenuator+ Version 1.0

User Manual

Thank you for purchasing this Attenuator+ module.

This module combines two attenuators with some flexible switching options.

Patch Ideas:

- **Performance control.** Feed two different envelopes into the A and B inputs. You can then adjust the levels and then switch between them to dramatically change your sound.
- **Switched Multiple.** Patch a clock signal into either input and turn the attenuator knobs all the way up. The clock signal will be available and the A, B and switched outputs and can be individually muted.
- **Fine tuning.** Switch 'FINE' to the down position. Patch a modulation / envelope CV into IN 'B' then patch OUT 'B' into IN 'A'. B level is now coarse adjustment and A is fine adjustment. Can be used to get precise pitch variation from a VCO.
- **Splitting audio.** Patch an audio signal into either input. A and B now output the same signal with levels controlled by the knobs. Can be used for Main/FX send or positioning a mono source to a stereo input.
